

Dear Activision Hiring Team,

I am excited to apply for the 2027 Summer Gameplay Engineering Internship at Activision. I am currently pursuing a B.S. in Computer Science in Real-Time Interactive Simulation at DigiPen Institute of Technology, where I have built a strong foundation in C++, data structures and algorithms, software architecture, computer graphics, and game engine development.

My strongest experience comes from building gameplay and engine systems for team-based game projects. As Technical Lead for *10..9..8..*, a 2D dungeon exploration game built around a limited-step mechanic, I helped design and integrate a custom C++ engine using an Entity Component System architecture. I worked with systems for turn management, enemy behavior, item management, grid-based collision, and reusable game objects while helping separate engine functionality from game-specific gameplay logic. This experience taught me how gameplay rules, engine architecture, and player-facing mechanics need to work together as one cohesive system.

I continued developing those skills on *Dragonic Tactics*, a 2D turn-based tactical RPG created by a five-person team, where I served as both Producer and Engine/Graphics Engineer. I refactored the custom C++ engine to integrate OpenGL directly, designed communication between gameplay and engine systems using an EventBus, and worked with a game built around positioning, resource management, character abilities, and asymmetric tactical combat. Alongside implementation, I coordinated milestones, technical priorities, and integration across the team.

Gameplay engineering especially interests me because it combines the parts of software development I enjoy most: designing systems, solving technical problems, and seeing those systems directly shape the player's experience. I enjoy working at the boundary between game design and engineering, where mechanics must not only be technically sound but also responsive, understandable, and enjoyable to interact with. Activision would give me the opportunity to bring my C++ and game-engine background into a larger production environment while learning how experienced engineers build and maintain gameplay systems at scale.

Thank you for your time and consideration. I would be excited to contribute my experience with C++, custom engine development, gameplay systems, and collaborative technical leadership while continuing to grow as a gameplay engineer at Activision.

Sincerely,
Taekyung (Jean) Ho
